## [VoIP breaks onto iPhone and iPod](#)

Voice calls over the internet have migrated onto Apple's new iPod and iPhone products through a new application created by VoIP technology developer Raketu.

Owners of the iPhone and iPod Touch can now use their device's web browser to make a connection over the web that allows them to talk to other people around the world.

Using the scheme means that international calls can be essentially free, although a monthly subscription fee to Raketu is required.

While the iPhone has already been targeted by other consumer VoIP services, Raketu's application is one of the first to work on the iPod Touch over its web connection.
