[Free Voip Calls From Raketu To 42 Countries & free video calls](#)

(For full text with comments please click on the title)

Free Voip Calls From Raketu To 42 Countries & free video calls

The famous facility of being able to make calls via the internet is known as VOIP, which stands for Voice over Internet Protocol. With this feature, a person can [make Voip calls](#) in the same way as in a regular phone connection, except that instead of a telecom provider, the calls will be delivered on the basis of the quality of the internet connection. Both local, as well as international calls can be made with such a service.

The greatest benefit with such a facility is that VOIP calls are either free, or at extremely cheap rates as compared to the conventional calling charges. An example to this is Raketu, a phone to phone service provider that makes use of pioneering technology, and offers as an excellent communication platform with great quality, all over the world.

It offers a wide range of services which include video chatting, instant messaging, telephony and teleconferencing etc. Apart from these basic services being offered by almost VOIP providers, Raketu also has a special web based VOIP platform, known as

Rak-Web.

With the services of this company, one can make free calls to the United Kingdom, along with more than 40 other countries. Besides, using Raketu services is extremely simple, and requires only the telephone number along with the destination to which one wishes to make a call.

It's working:

[Raketu](#) is a unique application as compared to its contenders in the market. Apart from being a mobile VOIP service, it also offers a combination of other facilities such as voice, media and even social networking. Customers can choose from a variety of options which include free, as well as cheap international call charges.

The good thing with this VOIP service is that it does not include super nodes, which makes calling to different parts of the world an easy and convenient affair, with guaranteed safety. The VOIP technology makes use of high speeds and computer processing, which converts the caller's voice into data packets. These data packets are then disintegrated to travel along a channel, and get integrated at the receiver's or the listener's end.

Thus, with Raketu, one line carries a huge amount of information, which makes it a cheaper medium as compared to others.

The software's functioning is based on three main aspects, which are communication, information and entertainment. Communication involves instant messaging, text messaging, voicemail, file transfer etc.; information includes providing latest updates in weather, news, online search, booking for airlines etc., and entertainment includes media player and applications like podcasts and games.

Raketu has managed to rope in the largest number of customers with great offers such as the cheapest call rates, and facilities of free calls to United Kingdom. The company is also promoting an initiative, wherein a customer gets free VOIP calls for 1000 trial minutes to the free calling zones. This plan costs \$7.95.
