Revolutionising Free VOIP Calls with Raketu

May 14th, 2009 • Raketu, VoIP Calls

The ellipsis for Voice over Internet Protocol is referred to as VOIP. This refers to the calling services provided through the internet instead of the conventional phone lines that goes through a telephone company. Instead of your telephone company delivering you local as well as international services, VOIP can deliver analogous services to you via a good quality internet connection.

The biggest advantage offered with this technology is that of free VOIP Calls or calling at highly subsidised rates when compared with the traditional telephone services. One such peer to peer service provider is Raketu. This VOIP service provider uses innovative technology combined with an exceptional quality of communication anywhere in the world.

The services provided include telephony, teleconferencing, instant messaging and video chats. These are some of the most basic services delivered by any of the VOIP providers. Raketu has launched their web based VOIP platform named Rak-Web.

This company offers free calls to UK and 42 other countries. Also using the services offered by them are very easy to use and it can be done by just entering phone number and destination to which you want to call.

How it works:

Raketu is different software when compared with its competitors because it's not only a mobile VOIP service provider but it is also a synthesis voice, media and social networking. It offers a combination of free and cheap international calling rates to its customers.

The advantage of using this VOIP service is that it does not have any super nodes and hence calling to any part of the world is made much easier, faster and secure. VOIP uses high speed technology and computer processing power which results in your voice being converted into packets of data. These packets are then bulleted along the line and reassembled on the other end.

Therefore, one line carries lots of information and hence using Raketu works out to be cheaper when compared with others.

There are 3 main parts which govern the functioning of this software

- **Communication:** This includes services such as voice communication, file transfer, instant messaging, sending text messages, voicemail services, viewing your call logs and conference calling options.
-
- **Information:** This part deals with providing customers additional facilities such as latest news feeds, weather reports, travel and booking facilities and online search with respect to any information.
-
- **Entertainment:** This is one of the added bonuses offered to the users who use the services of Raketu which include access to media player, additional applications, wide range of games to pick from and play and the podcasts.

Offering the lowest possible call rates and chipping in with free calls to UK is the strategy Raketu has applied to attract the maximum number of customers. This company is also marketing a \$7.95 plan of free VOIP calls of 1000 trial minutes to its free calling zones.
