Raketu Launches VoIP over BlackBerry

Raketu has launched a new peer-to-peer VoIP application designed to run on Research in Motion Blackberries. The app furthermore is intended to be used by enterprise, small and mid-sized business users.

Raketu does not require a client download and is accessed from the BlackBerry's Web browser at www.BlackBerry.raketu.com.

The application obviously will make most sense for business users who need to send and receive text messages from international locations, as well as users who need voice communications in a global context.
